

So I own both a Mac and a PC and have previously played around in CLI on both platforms in the past. Firstly, I have to say I'm very glad we use GUI over CLI. Going back through and refreshing myself on some of the commands brings me back to setting up Minecraft servers through batch files. Understanding how the directories of your operating system is always something good to know, especially when things become corrupted, and your GUI starts to fall apart. Something as simple as just trying to find archived files (hidden files) becomes a lot easier if you are unfamiliar with a certain GUI but are confident in using the CLI format.

Secondly, I'm incredibly glad we aren't forced to use CLI on a regular basis anymore just due to having to learn the coding language. On the surface it seems simple, but if you aren't careful, you could do a lot more damage to your operating system if you weren't careful, moving directories, renaming files, and even deleting them. It definitely feels like a double edged sword doing things in the Command Line Interface. I also feel that the migration to Graphical User Interface over the continued use of CLI really shows how universal computer use has become.

Finally, I have to say I definitely prefer GUI over CLI. Call me a spoiled child, but if I had to continually use CLI to use a computer, I think I would have thrown it into the street a long time ago. Joking aside, it definitely shows advancement in computing.
